"The covalent structure of calf skin type III collagen. VI. The amino acid sequence of the carboxyterminal cyanogen bromide peptide alpha 1(III)CB98 (positions 928-1028).";

Hoppe-Seyler's Z. Physiol. Chem. 360:861-868(1979).

-I- FUNCTION: COLLAGEN TYPE III OCCURS IN MOST SOFT CONNECTIVE TISSUES ALONG WITH TYPE I COLLAGEN.

-I- SUBUNIT: TRIMERS OF IDENTICAL ALPHA 1(III) CHAINS. THE CHAINS ARE LINKED TO EACH OTHER BY INTERCHAIN DISULFIDE BONDS. TRIMERS ARE ALSO CROSS-LINKED VIA HYDROXYLYSINES.

-I- PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SEQUENCE OF 809-947.

FUNCTION: NEWATODE CUTICLES ARE COMPOSED LARGELY OF COLLAGEN-LIKE
PROTEINS. THE CUTICLE FUNCTIONS BOTH AS AN EXORKELETON AND AS A
BARRIER TO PROTECT THE WORM FROM ITS ENVIRONMENT.
SUBUNIT: COLLAGEN POLYPEPTIDE CHAINS ARE COMPLEXED WITHIN THE
CUTICLE BY DISULFIDE BONDS AND OTHER TYPES OF COVALENT CROSS-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SIMILARITY: BELONGS TO THE CUTICULAR COLLAGEN FAMILY.

NIDGEN.

NIDGEN.

1. SUBUNIT: THERE ARE SIX TYPE IV COLLAGEN ISOFORMS, ALFHA 1(IV)-ALFHA 6(IV), EACH OF WHICH CAN FORM A TRIBLE HELIX STRUCTURE WITH 2 COTHER CHAINS TO GENERATE TYPE IV COLLAGEN NETWORK.

1. SUBCELLULAR LOCATION: CELL SURFACE (POTENTIAL).

1. ALTERNATIVE PRODUCED BY ALTERNATIVE SPLICING. THEY DIFFER IN THEIR 3/L5, ARE PRODUCED BY ALTERNATIVE SPLICING. THEY DIFFER IN THEIR C-TERMINAL NC1 DOWAINS.

1. COCHLEA, LUNG AND PRESENT ONLY IN BASEMENT MEMBRANES OF KIDNEY, EYE, COCHLEA, LUNG AND BRAIN.

1. DOWALN (NC1) AT THEIR C-TERMINUS, FREQUENT INTERRUPTIONS OF THE COCHLEA, LUNG AND BRAIN.

1. DOWALN: ALFHA CHAINS OF TYPE IV COLLAGEN HAVE A NONCOLLAGENOUS DOWALN (NC1) AT THEIR C-TERMINUS, FREQUENT INTERRUPTIONS OF THE GAY.Y REPEATS IN THE LONG CENTRAL TRIPLE-HELICAL DOWAIN (WHICH MAY CAUSE FLEXIBILITY IN THE TRIPLE HELIX), AND A SHORT N-TERMINAL TRIPLE-HELICAL JOBAIN.

1. POM: PROLINES AT THE THIRD POSITION OF THE TRIPLETIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.

1. PIM: THE ALTERNATIVE SPLICED FORM V CONTAINS AN ADDITIONAL N-LINKED GLYCOSYLATION SITE.

1. PIM: TYPE IV COLLAGENS CONTAIN NUMBEROUS CYSTEINE RESIDUES WHICH ARE INVOLVED IN INTER- AND INTRAMOLECULAR DISULFIDE BONDING. 12 OF THE STATEMENT OF THE TOTOLAGENS TYPE TO COLLAGENS ON TAXIN ARE CONSERVED IN ALL KNOWN TYPE TO COLLAGENS IN THE SILULATION ARE CONSERVED IN ALL KNOWN TYPE TO COLLAGENS IN THE SILULATION ARE CONSERVED IN ALL KNOWN TYPE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Alternative splicing of the NC1 domain of the human alpha 3(I collagen gene. Differential expression of mRNA transcripts tha predict three protein variants with distinct carboxyl regions. J. Biol. Chem. 269:2342-2348(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Reeders S.T., Smeets H.J.M.;

"Mutations in the type IV collagen alpha 3 (COL4A3) gene in autos "mutations in the type IV collagen alpha 3 (COL4A3) gene in autos recessive Alport syndrome.";

Hum. Mol. Genet. 3:1269-1273(1994).

-I- FUNCTION: TYPE IV COLLAGEN IS THE MAJOR STRUCTURAL COMPONENT GLONERULAR BASEMENT MEMBRANES (GBM), FORMING A 'CHICKEN-WIRE' MESHWORK TOGETHER WITH LAMININS, PROTEOGLYCANS AND ENTACTIN/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -

IV COLLAGENS.

IV COLLAGENS.

PTM: Phosphorylated by the Goodpasture antigen-binding protein.

PIME PROSPHORYLATED LIST THE NC1 DOWAIN OF ALPHA3(IV) MEDIATE

DISEASE: ANTIBODIES AGAINST THE NC1 DOWAIN OF ALPHA3(IV) MEDIATE

THE HUMAN AUTOLMMUNE DISEASE, GOODPASTURE SYNDROME, WHICH IS

CHARACTERIZED BY HEMATURIA AND PULMONARY HEMORRHAGE.

DISEASE: DEFECTS IN COL4A3 ARE ASSOCIATED WITH THE TYPE I

AUTOSOMAL RECESSIVE FORM OF ALFORT SYNDROME, AN HEREDITARY

GLOMERULONEPHROPATHY CHARACTERIZED BY PROGRESSIVE REMAL FAILURE,

GLOMERULONEPHROPATHY CHARACTERIZED BY PROGRESSIVE REMAL FAILURE,

HEMATURIA AND DEAFNESS. THE RECESSIVE FORM OCCURS EQUALLY BETWEE!
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Biol.

Blochem. J. 273:141-148(1991).
Blochem. J. 273:141-148(1991).
-i- FUNCTION: TYPE X COLLAGEN IS A PRODUCT OF HYPERTHROPHIC CHONDROTOCYTES AND HAS BEEN LOCALIZED TO PRESUMPTIVE MINERALIZATION ZONES OF HYALINE CARTILAGE.
-i- SUBUNIT; HOMOTRIMER.
-i- SUBUNIT; HOMOTRIMER.
-i- SUBUNIT; HOMOTRIMER.
-i- PIM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEA UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.
-i- SINILARITY: STRONG, TO ALPHA 1 AND 2 TYPE VIII COLLAGENS.
-i- SINILARITY: CONTAINS 1 CIQ DOMAIN.

Heterozygous Asn-1437 individuals have a 2.5 times increased chance of developing prostate cancer as compared with homozygous Asp-1437 individuals. DISEASE: Defects in COL1881 are a cause of Knobloch syndrome (KS or KNO); an autosomal recessive disorder defined by the occurrence of high myopia, vitreoretinal degeneration with retinal detachment, macular abnormalities and occipital encephalocele. SIMILARITY: BELONGS TO THE FIBRII-ASSOCIATED COLLAGENS WITH INTERRUPTED HELICES (FACIT) FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MOST TISSUES AND TRIMERS OF ONE ALPHA 1(V), ONE ALPHA 2(V), AND ONE ALPHA 3(V) CHAIMS IN PLACENTA.

PM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.

DIERASE: Defects in COL5A2 are a cause of Ehlers-Danlos syndrome gravis or type I (EDS-I), and Ehlers-Danlos syndrome mitis or type II (EDS-I), and Ehlers-Danlos syndrome is a genetically and phenotypically heterogeneous connective-tissue disorder characterized by loose-jointedness and fragile, velvety, stretchable, bruisable skin that heals with peculiar 'cigarette-paper' scars. EDS-I and EDS-II are autosomal dominant traits.

SIMILARITY: CONTAINS 1 VWFC DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                             HGNC:2210; COL5A2

FUNCTION: MAJOR COMPONENT OF THE DESCEMET'S MEMBRANE (BASEM FUNCTION: MAJOR COMPONENT OF THE DESCEMET'S MEMBRANE (BASEM MEMBRANE) OF CORNEAL ENDOTHELIAL CELLS.

SUBUNIT: MAY FORM HOMOTRIMERS, OR HETEROTRIMERS IN ASSOCIAT WITH ALPHA 2 (VIII) TYPE COLLAGENS.

PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEAUNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.

MISCELLANGOUS: FOUR CONSECUTIVE GLY-PRO-PRO TRIPLETS ARE PROMISECULAR CONSECUTIVE GLY-PRO-PRO TRIPLETS ARE PROMISECULAR STABILITY OF THIS REGION.

THE HIGH THERMAL STABILITY OF THIS REGION.

SIMILARITY: STRONG, TO ALPHA 2 TYPES VIII AND X COLLAGENS.

                                                                                           INTERNATIVE PRODUCTS: 2 ISOFORMS; I (SHOWN HERE) AND BETWEEN NC1

-I- ALTERNATIVE PRODUCTS: 2 ISOFORMS; I (SHOWN HERE) AND II; ARE
PRODUCED BY ALTERNATIVE SPLICING.

-I- DOMAIN: ALPHA CHAINS OF TYPE IV COLLAGEN HAVE A NONCOLLAGENOUS
DOMAIN (NC1) AT THEIR C-TERNINUS, PREQUENT INTERRUPTIONS OF THE
G-X-Y REPEATS IN THE LONG CENTRAL TRIPLE-HELICAL DOMAIN (WHICH MAY
CAUSE FLEXIBILITY IN THE TRIPLE HELIX), AND A SHORT N-TERMINAL
TRIPLE-HELICAL 75 DOMAIN.

-I- PTM: PROLINES AT THE THIRD POSITION OF THE TRIPPETIDE REPEATING
UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.

-I- PTM: TYPE IV COLLAGENS CONTAIN NUMEROUS CYSTEINE RESIDUES WHICH
ARE INVOLVED IN INTER- AND INTRAMOLECULAR DISULFIDE BONDING. 12 OF
THESE, LOCATED IN THE NC1 DOMAIN, ARE CONSERVED IN ALL KNOWN TYPE
IV COLLAGENS.

MEMBRANE) OF CORNEAL ENDOTHELIAL CELLS.

-I- SUBUNIT: WAY FORM HOMOTRIMERS, OR HETEROTRIMERS IN ASSOCIATION WITH ALPHA 2 (VIII) TYPE COLLAGENS.
-I- TISSUE SPECIFICITY: HIGH LEVELS IN CALVARIUM, EYE & SKIN OF NEWBORN MICE, ALSO IN VARIOUS EPITHELIAL, ENDOTHELIAL AND MESENCHYMAL CELLS.
-I- PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL OF THE CHAINS.
-I- SIMILARITY: STRONG, TO ALPHA 2 TYPES VIII AND X COLLAGENS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CA18 OUSE STANDARD; PRT; /43 AA. 000780; Q9D2V4; O1-NOV-1995 (Rel. 32, Created)

Parasitol. 37:73-86(1989).

FUNCTION: NEWATODE CUTICLES ARE COMPOSED LARGELY OF COLLAGEN-LIKE PROTEINS. THE CUTICLE FUNCTIONS BOTH AS AN EXOSKELETON AND AS A BARRIER TO PROTECT THE WORM FROM ITS ENVIRONMENT.

BARRIER TO PROTECT THE WORM FROM ITS ENVIRONMENT.

REGIONS, WHICH CONTAIN GLYCINE AS EVERY THIRD AMINO ACID.

MISCELLANGOUS: THE FOLYPETIDE COLLAGENS, THE POLYPEPTIDE CHAINS ARE COMPLEXED WITHIN THE CUTICLE BY DISULFIDE BONDS AND OTHER TYPES OF COVALENT CROSS-LINKS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: BELONGS TO THE CUTICULAR COLLAGEN FAMILY.

DISEASE: Defects in COLILA2 are the cause of Stickler syndrome type 3 (STL3). It is an autosomal dominant disorder characterized by oro-facial, auditory and skeletal manifestations, such as midfacial hypoplasia, cleft palate, osteoarthritis, and sensorineural hearing loss. Differently from Stickler syndrome type 1 and 2, no ocular involvement is observed. This disorder is also referred to as Stickler-like syndrome or non-ocular Stickler
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pediatr.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             autosomal dominant skeletal disorders (Stickler and Marshall syndromes) but can be distinguished by disproportionately short limbs and lack of ocular involvement.

DISEASE: Defects in COLIIA2 are the cause of Meissenbacher-
Zweymueller syndrome (MZS), an autosomal dominant disorder allelic with STL3 and OSMED. It is also referred to as heterozygous OSMED.

DISEASE: Defects in COLIIA2 are the cause of autosomal dominant nonsyndromic sensorineural dathess type 13 (DPNA13). Affected individuals experience progressive hearing loss beginning in the second to fourth decades, eventually making use of amplification making use of amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MATCHESCULY:
